

FLIES

Risks

Flies can be both a nuisance and a health risk. They have been known to spread illnesses including typhoid fever, cholera, and many others. Most commonly this will happen when a fly lands on human or animal fecal matter, and then later lands on food or in water. In this way bacteria are transferred from the fecal matter to the human via the fly, and it often goes unnoticed. It is important for any business to control flies, particularly food handling establishments, food processing facilities, and food storage facilities.

Fly Control

Using insect light monitors, or fly lights, is an effective method in supplementing a fly solution. These devices not only fit into the Integrated Pest Management (IPM) approach to pest control that CNY Pest Control proudly implements but multitask in that they can be effectively used on pests other than flies. Other mechanical methods to control flies, such as pheromone sticky traps, are also effective to different degrees. Insect light monitors and more are available through CNY Pest Control, as well as services on these devices.

An important part of fly control is sanitation. Keeping up with the sanitation needs of your business can stop a fly problem from becoming a real issue.

CNY Pest Control

Regularly cleaning garbage cans and dumpsters, making sure that you are using biodegreasers, and keeping floor drains clean and free of biological build-up are just some of the things that you can do. CNY Pest Control offers a variety of products and services in the area of sanitation, making this process even.
